@Wenbin

- Overall good progress, but there are some issues in your current implementations.
 - The coding in "gogol.ppm.huffman_code" looks strange. Anything wrong?
 - It is okay that you use ascii "01", instead of binary digits. (the size of encoded file becomes much larger). However, the delimiter (i.e., spaces " ") should not be in the encoded file. Actually, Huffman decoding does not need delimiters.
- Here is another implementation online:
<https://github.com/Eyenseo/Image-Compression>
 - Let's try to use this one instead;
 - Redo the Step 3.
 - Find out what kinds of errors cause serious display issues; what kinds of errors are acceptable (or visually hard to observe).
